

Explanation of L2 norm of an error

When solving for the sparsest possible set of DEs, it is likely our found model will **not** describe the data exactly - there will be an error

Therefore we can measure the error and give the user it's ℓ^2 -norm

- The error is a vector of errors at each time-step
- More information regarding the ℓ^2 -norm is [here](#)

When working with 2 or more dimensional data, the ℓ^2 -norm returned will be vector of ℓ^2 norms in each coordinate
